# 1 Safety instructions

**DANGER!**

**Danger for children**

Ensure that plastic bags, packaging, etc. are disposed of properly and are not within reach of babies and young children. Choking hazard!

Ensure that children do not detach any small parts (e.g. knobs or the like) from the unit. They could swallow the pieces and choke!

Never let children unattended use electrical devices.

## 2 Note

This document is a general guide showing typical steps for setting up a drum set.

*Depending on the model, there can be variations in the type and number of components.*

### 3 Unpacking

#### Assigning

The following guide makes it easy for you to completely assemble your drum set, to tune it and to set it up properly.

The complete drum set is supplied in one cardboard box. It is supplied dismantled in its individual parts. We recommend that you first sort the individual parts that belong together as described below.

#### Snare drum

The snare drum is delivered fully assembled. The drum heads are already fitted.

#### Bass drum

Due to the size of the bass drum, it is always supplied dismantled.

The bass drum includes the following parts:

- 1 drum shell
- 2 hoops
- 2 bass drum heads (1 × resonant and 1 × batter head)
- 12 clamping screws (square-head) with one washer each
- 12 claw hooks
- 2 bass drum spurs

#### 2 hanging toms

The hanging toms are delivered fully assembled. The drum heads are already fitted.

## Floor tom

The floor tom includes the following parts:

- 1 drum shell
- 2 hoops
- 2 heads
- 10 tension rods with one washer each
- 3 spurs

## Hardware package

The hardware package includes the following parts:

- 1 bass drum pedal

1 hi-hat stand

1 snare stand

1 straight cymbal stand

2 tom holders

## Accessories

The accessories include the following parts:

- 1 tuning key
- 1 pair of drumsticks

## Cymbals

Depending on the scope of supply, a set of cymbals is included:

- 1 crash / ride cymbal (12 inch)
- 1 hi-hat cymbal (10 inch)

### 4 Setting up the bass drum

Let's start with the bass drum.

Position the bass drum shell such that the screws of the tom holder point downwards.

Now lay the white resonator head on the shell and put a hoop over it. Both the hoops are identical so it doesn't matter which one you put on first. Align the white resonator head such that the "Millenium" writing is parallel to the tom holder. The head must be lying evenly on the edge of the shell on all sides.

**The next thing we need are the tension rods.**

Proceed as follows: Put the washer on the screw and then the claw hook. We need 6 square-head screws per side.

Hand-tighten all six screws. When doing this, tighten the screws in the diagonally opposite sequence. You only need to tighten the screws slightly, we will be tuning the drums later on.

Now turn the shell by 180° to mount the transparent batter head.

*If you want to dampen the bass drum, now would be just the right time to put the damper pillow in the shell to do this.*

#### Mounting the beater head

The transparent batter head is used on the beater side. When mounting it, we proceed in just the same way as with the resonator head. Put the head on first and lay the hoop on it, put the washers and claw hooks on the tension rods and screw them on. Do not tighten them too much; only enough for the hoops not to be shifted. We'll do everything else when we tune the drums. So that's the bass drum finished; now we'll do the toms.

## 5 Assembling the floor tom

The principle of assembling the floor tom is basically the same as with the bass drum. The shell is smaller which means that they don't have as many tension rods. The hoops are made of steel. This means that they don't need any claw hooks; rather, you screw them on directly. The tension rods aren't as long as with the bass drum either, since the hoops are not as wide.

To make the hoops easier to transport, they are fixed on one side of the shell with a couple of screws. To mount the heads, you must first completely remove the hoops.

Now lay a head on the shell and put a hoop over it. Both the hoops and heads are exactly the same so it doesn't matter which one you use where. If you look from the top, you can see whether the head and the hoop are really contacting the middle of the drum shell.

You now screw in five tension rods per side. With the tension rods, you must always ensure that the each washer is inserted.

You hand-tighten the tension rods in the diagonally opposite sequence. Like the bass drum, we will be tuning later on.

You can now attach the legs. Fix the two legs at the back in about the middle. First lightly fix the leg facing the drummer by hand and then fasten it properly when it is standing. Hold the shell with one hand while screwing it with the other one.

## 6 Assembling the bass drum pedal

Let's concentrate on the hardware first. You have to assemble the bass drum pedal first.

The flat rod below the pedal must be pushed forward into the holder and then fastened with the screw.

Now you screw the beater into the holder.

### **NOTICE!**

Do not stick the bottom end of the shaft in too far; otherwise, it could damage the bass drum head.

You can make all the other settings later on. A separate user guide is enclosed for the the bass drum pedal.

## 7 Assembling the hi-hat

Pull the stand's three legs far enough apart until there is optimum stability between the base point of the stand and the legs. A wing nut ensures that the legs do not move out of position.

As with the bass drum pedal, the hi-hat's pedal is stabilized by pushing the pedal forward into the holder and then fastening it with the screw.

The next thing to do is to tightly screw home the pull rod in the stand's thread. Put the centre tube over the pull rod and screw it tight.

We will adjust the height exactly later on once we have positioned the hi-hat stand in the correct location and attached the cymbals.

## 8 Assembling the cymbal stands

The legs of the straight cymbal stand are folded out or extended until it stands secure. After this, you fix the legs using the wing nut.

Push the centre and spacer tubes onto the bottom case and fix them with the wing screws. We will make the final settings later on. The cymbal holder is directly on the retractable spacer tube. You attach the cymbals in exactly the same way as with the hi-hat-stand after positioning.

## 9 Assembling the snare drum stand

In the case of the snare drum stand too, you fold out the three legs and fix them with wing nut. Now put the top part with the arms into the lower section and screw it tight.

Screwing down the union nut opens the support arms. The union nut on the joint allows you to set the angle of the drum. Here too, we will make all the necessary settings later on when positioning the set.

### 10 Tuning the shells

#### Basics

All the drum shells are mounted. All the hardware is assembled.

Always tighten the tension rods in the diagonally opposite sequence to ensure even tension. You should tighten all the screws evenly. At the beginning, don't turn the screw by more than one rotation – towards the end, rotate by  $\frac{1}{4}$  to  $\frac{1}{8}$  of a turn. Then check the pitch.

You check the pitch by tapping the head about 3 cm from the rim near the screw that you are just setting.

You tune the batter and resonator heads to the same pitch. You can, of course, change the pitch to match your own personal taste.

#### Snare drum

The snare drum is supplied completely assembled. Apart from a couple of slight corrections, the pitch should be OK. To check, tap a few times near the tension rods. All the tones should sound the same.

Proceed in the same way with the resonator head. When checking the pitch, the snare should not be touching. To do this, completely release the snare wires and put a drum stick between the edge of the hoop and the snare wires (the stick should not touch the drum head).

After tuning, you must tension the snare again. By the way, the snare tension has a significant effect on the vibration of the resonator head and the typical snare sound. You just have to keep trying until you find a sound you like.

#### Bass drum

Tighten all the screws evenly finger-tight. Start with the beater side. First press fairly hard with both hands on the head to press it on to the shell evenly. When you do this, the head may make noises but that's normal.

Now tighten the tension rods in the diagonally opposite sequence by one turn until the head is tuned to a pitch. A good way to check is by the reflection on the head – you shouldn't be able to see any wrinkles.

*The bass drum head is often not tensioned as much as you would think.*

Tune the resonator side of the bass drum in exactly the same way.

#### Hanging toms and floor tom

You proceed in the same way with the hanging toms and the floor tom. Seat the head slowly and evenly. At first, press the head down with your hands to seat it well. Tap your finger along the rim to check: you should hear a ringing tone. You shouldn't be able to see any more wrinkles.

The sounds of the three toms should also harmonise. The sounds should harmonise while you're tuning the heads. Don't be afraid to play the other two toms to ensure that the tones harmonise. Don't tune the resonator heads until you have tuned the heads on all three toms. You tune the batter and resonator heads to the same pitch. This considerably amplifies the drums' sounds. As you come closer to the pitch of the beater head when tuning the resonator head, the drum shell gets louder and clearer with more punch.

Hit the beater head and the resonator head to compare. You will then quickly realise whether the same pitch is produced on both heads. If you tension the head too much, you lose the clear sound of the shell. Then, the easiest thing to do is to evenly loosen all the tension rods (count the turns) and start from scratch. It is not possible to tune drum heads backwards little by little.

### 11 Setting up the drum set

For optimum playing, we don't just need tuned drums; rather, it is also necessary to position all the drums in an optimum way. We now make all the settings that we neglected before. The set-up that is described here is intended for right-handers. The set-up for left-handers is a mirror image of this one. A non-slip surface like a carpet or similar guarantees stability.

#### Drum stool

Let's start with the drum stool. Set the height such that your thighs are almost horizontal. This allows you to sit comfortably and not to tire when using the bass drum and hi-hat pedals.

#### Snare drum stand

The next job is to take the snare drum stand and fix the snare drum on it. To do this, open the arms far enough to be able to reach over the bottom hoop. After this, tighten the union nut such that the snare drum cannot fall off the stand. It is important to ensure that none of the three arms affects the snare or the throw-off lever. The throw-off lever should face the drummer so that it is easy to operate.

Now set the height of the snare drum such that the hand holding the drumstick can touch the head without hitting your thigh. A slight lean towards the drummer makes drumming – and rimshots in particular – easier.

#### Completing the bass drum

Now that we've tuned our bass drum, it's time to mount the bass drum pedal and the tom racks on the bass drum shell. Let's start with the bass drum legs. The bass drum spurs are inserted into the openings provided on the left and right sides of the bass drum. The further the bass drum spurs are inserted, the smaller the distance between the floor and the lower edge of the clamping rings. Let's set the bass drum spurs so long that the distance is a finger's width. The drum shell should not lean forward or towards the player. The bass drum spurs are locked with the screw.

Now you can push the assembled bass drum pedal onto the clamping ring and fix it with the claw. Use some gaffa tape to protect the hoop from scratching.

Now, there's only the tom racks. There are different designs. The tom holder – that's the clamp for the tom arms on the bass drum – is intended for one or two tom arms. This means that if only one tube fits in, there is an adapter for both tom arms. Our tom holder takes both tom arms directly.

Here too, there are memory clips that have a cutout. Here, the clip not only "remembers" how far you put the tube in but also at what angle.

### Bass drum and hi-hat

The snare drum is now between the drummer's knees and we will add the bass drum and hi-hat stands. The bass drum and hi-hat pedals are placed where the drummer's feet rest naturally when they are in a normal upright seated position. In this connection the knees must not touch the snare drum.

The bass drum with pedal comes on the right-hand side and the hi-hat stand on the left-hand one. The two pedals form a V shape pointing towards the stool. Positioning these 3 elements, snare, bass drum and hi-hat is very important. The rest of the set results almost automatically from this.

*The lower hoop of the snare drum should be just above the bass drum's hoop.*

## Setting up the drum set

---

The hanging toms are next. Put each tom shell in the bracket arm and screw it tight. The tom shells are drilled through and the bracket arms are pushed into the shell.

Mount the smaller tom to the left of the drummer and the larger one to their right. As with the snare drum the heights and angles of the toms depend on the height at which the drummer is seated. In this connection, it should be possible to play the drumstick as parallel as possible to the head.

With small people, the tom should be angled more than with larger ones. Mount both toms at the same height and the same angle. They should not sit on the bass drum or touch one another.

Now there's just the floor tom. Set up the floor tom next to your right thigh. When doing this, ensure that there is enough space between the snare drum and the floor tom. Your leg must have enough space to the left and the right.

The height of the floor tom depends on the height of the snare drum. Both hoops should be at the same height. The floor tom's head is not angled; rather, it is horizontal. Viewed from above, the snare drum, the hanging toms and the floor tom are aligned in a V shape.

## 12 Attaching the cymbals

Our drum set is starting to take shape. We've already found the position of the hi-hat stand. What's missing now is attaching the hi-hat cymbals and adjusting the height.

### Attaching the hi-hat cymbals

First place a metal washer and the felt disk on the hi-hat stand. Then the bottom cymbal (labelled "bottom"). Lie it freely onto the stand's felt disk.

We have to make some preparations for the top cymbal (labelled "top"). The top cymbal is fitted with a hi-hat clutch. To do this, turn the holder upside down and lay it in the palm of your hand. Now put on a felt disk, the top cymbal (with the dome downwards), another felt disk, a washer and the screw connection.

Now push the top cymbal over the pull rod such that it lies loosely on the bottom hat.

Now adjust the height of the stand such that the bottom of the hi-hat cymbal is about the width of your hand above the snare drum's hoop.

Now tread the hi-hat pedal half way down and tighten the wing screw of the hi-hat clutch.

### Attaching the ride and crash cymbals

The ride cymbal is placed on the right between the floor tom and the right-hand hanging tom. As with the hi-hat, you screw the cymbal between two felt washers. Now position the cymbal such that you can comfortably reach it with your drumstick it doesn't hit the shell.

## Attaching the cymbals

---

Now all the parts are in place and you can start to play.  
Have lots of fun with your new drum set.

## 13 Protecting the environment

### Disposal of the packaging material

For the transport and protective packaging, environmentally friendly materials have been chosen that can be supplied to normal recycling.

Ensure that plastic bags, packaging, etc. are properly disposed of.

Do not just dispose of these materials with your normal household waste, but make sure that they are collected for recycling. Please follow the notes and markings on the packaging.
